

8 Steps to Prepare Your HVAC System for Spring

It's always good practice to routinely check your HVAC system before every heating and cooling season. Winters can be harsh and can take a toll on buildings, from freezing pipes to compromising structural integrity. Low temperatures, along with extended times below freezing, can also impact your air conditioning system.

By following just a few simple steps for maintaining your HVAC system, you can ensure a cool start to spring.

Outdoor Inspection

- Remove any condenser covers, coil blankets or lids
- Inspect the outdoor unit panels
- Remove any debris from the outdoor coil
- Repair or replace any damaged pipe insulation

Indoor Inspection

- Change your indoor air filters
- Check the condensate drain lines
- Clean the supply vents and return grills
- Turn it on and make sure it works throughout the day
